```cpp
#include <iostream>              // Header file for input and output
#include <fstream>               // Header file for file handling
using namespace std;             // Use standard namespace

int main()                       // Main function
{
    ifstream fin("source.txt");    // Open source.txt for reading
    ofstream fout("destination.txt"); // Open destination.txt for writing

    char ch;                     // Variable to store one character at a time

    if (!fin)                    // Check if source file is opened or not
    {
        cout << "Source file not found!"; // Display error message
        return 0;                // Stop the program
    }

    while (fin.get(ch))          // Read characters until end of file
    {
        fout.put(ch);            // Write each character into destination file
    }

    cout << "File copied successfully!"; // Display success message

    fin.close();                 // Close source file
    fout.close();                // Close destination file

    return 0;                    // End the program
}
```
