```
#include <iostream>      // For input and output
#include <cstring>       // For strlen() and strcpy()
using namespace std;     // To use cout without std::

class String             // Creating a String class
{
   char *str;            // Pointer to store the string

public:

   // Constructor
   String(const char *s)
   {
      str = new char[strlen(s) + 1];  // Allocate memory dynamically
      strcpy(str, s);                 // Copy the given string
      cout << "Memory allocated" << endl;
   }

   // Function to display the string
   void display()
   {
      cout << "String: " << str << endl;  // Print the string
   }

   // Destructor
   ~String()
   {
      delete[] str;                   // Free allocated memory
      cout << "Memory deallocated" << endl;
   }
};

// Main function
int main()
{
   String s1("Hello World");  // Create object and call constructor

   s1.display();              // Call display function

   return 0;                  // End the program and call destructor
}
```
