```
#include <iostream>                // Header file for input and output
using namespace std;               // Use standard namespace

// Base class
class Customer
{
public:
   virtual void calculateDiscount() // Declare a virtual function
   {
      cout << "General Customer Discount" << endl; // Display message
   }
};

// Derived class 1
class RegularCustomer : public Customer  // Inherit Customer class
{
public:
   void calculateDiscount() override  // Override virtual function
   {
      cout << "Regular Customer Discount: 5%" << endl; // Display 5% discount
   }
};

// Derived class 2
class PremiumCustomer : public Customer  // Inherit Customer class
{
public:
   void calculateDiscount() override  // Override virtual function
   {
      cout << "Premium Customer Discount: 15%" << endl; // Display 15% discount
   }
};

// Main function
int main()
{
   Customer *c;                  // Create base class pointer

   RegularCustomer r;            // Create RegularCustomer object
   PremiumCustomer p;            // Create PremiumCustomer object

   c = &r;                       // Store address of regular customer
   c->calculateDiscount();       // Call RegularCustomer function
```

```
    c = &p;                     // Store address of premium customer
    c->calculateDiscount();     // Call PremiumCustomer function

    return 0;                   // End the program
}
```
